## ***Compressed Air Safety***

Compressed air is not something to play with and must be used in a safe manner. Before grabbing an air hose, there are a number of safety guidelines which should be followed.

### **General:**

- Be sure you have the right air hose. Air hoses look alike. Sometimes hose lines are crossed and you could be fooled.
- Avoid using compressed air for any type of cleaning. When it is used for cleaning, be sure to reduce the air to less than 30 psi.
- Before operating an air hose, examine all connections to make sure they are tight and will not come loose under pressure; hold the nozzle when turning the air on or off.
- Don't kink the hose to stop the air flow; always turn off the air at the control valve.
- Check the air hose carefully to make sure it is in good condition before opening the valve to let air into the hose; when the job is finished, turn off the valves on both the tool and the air-line.
- Keep air hoses out of aisle ways where they can be damaged by traffic or be a tripping hazard.
- Never point a compressed air hose nozzle at any part of your body or at another person
- The operator and any other workers who must be in the immediate cleaning area must wear eye protection and other necessary personal protective equipment.

**You can prevent accidental injury when working with compressed air. Remember it's a tool, not a toy, so don't mess around with it.**
